I'm excited to apply my 1.5+ years of Node.js expertise to build scalable backend systems at AppifyDevs. Having optimized RESTful APIs and MongoDB databases in production environments, I'm particularly drawn to your focus on architectural patterns like CQRS – which aligns perfectly with my interest in clean, maintainable systems. The opportunity to mentor junior developers while working with technologies like NestJS and WebSockets would allow me to contribute my experience in real-time systems and third-party integrations. I'm especially impressed by AppifyDevs' commitment to cutting-edge solutions and would love to help drive key database architecture decisions.
